

AUTONOMOUS LIQUIDATION PROTECTION FOR AAVE V3 ON BASE

KEEPERHUB · AGENTS ONCHAIN · FINALIST · AUG 19 2026

**MOST LIQUIDATIONS ARE SLOW
LEAKS — POSITIONS DRIFTING FOR
HOURS WHILE THEIR OWNERS
SLEEP.**

\$19B

OCT 2025 · LIQUIDATED IN ONE CASCADE

plenty of owners were wide awake — locked out of
the infrastructure they needed.

WATCHING IS NOT PROTECTION.

TWO MODELS ARGUE. DETERMINISTIC CODE DECIDES.

SENSE

PLAN

CRITIQUE

GUARD

EXECUTE

RECORD

The Planner proposes exactly one action, with one amount.

An independent Critic must return an explicit **APPROVE**.

The Guard — not a model — re-derives every number and can veto them both.

ON AUGUST 1ST IT CAUGHT A REAL POSITION ON
BASE MAINNET — UNATTENDED.

1.2400 → 1.6028 HEALTH FACTOR

REPAID

\$6.78 USDC – the exact figure the
Guard re-derived

SENSE TO LANDED

21 seconds

GAS

184,531 – sponsored; the wallet
needed no ETH

GUARD

12/12 checks · 0 violations

BASESCAN · BASE MAINNET · UNRETOUCHED

Timestamp: 8 days ago |  Aug-01-2026 09:33:11 PM +UTC 

tx 0x6e314ece...9cd05

NOTHING THE MODELS SAY IS TRUSTED.

14 deterministic rules re-derive every figure the models claimed.

Neither model can name an address – addresses exist only in an allowlisted config.

No Critic APPROVE, no execution. DRY_RUN by default; mainnet also needs ARM=1.

12 rules on the day of the save – two more came out of adversarial review.

It refuses absurd prices: Aave's oracle is cross-checked against Chainlink; divergence blocks. (Moonwell's \$1.12 cbETH print · Aave's \$27M CAP0 glitch.)

EVERY WRITE GOES THROUGH KEEPERHUB — AND THE WORKFLOW RE- READS THE CHAIN BEFORE IT WILL ACT.

webhook workflow — the only path that moves money

in-workflow re-read + Condition gate

write-contract repay

execution API + backoff polling

gas sponsorship on every tx

MCP server + plugin

marketplace + x402

RIPCORD PAYS FOR ITSELF.

The risk engine is listed on the KeeperHub marketplace. A second agent – its wallet holding zero ETH – paid for two calls in USDC over x402.

\$0.10 → the same wallet the daemon defends

Verify with no account: an unpaid POST returns a live HTTP 402 whose payTo is the defended wallet. Live today at \$0.02/call.

THE SYSTEM CAUGHT ITS OWN MISTAKES — THAT RECORD IS WHY YOU CAN TRUST IT.

Two adversarial review rounds – 22 and 31 candidate findings, each independently refuted before it counted.

- × a mock sensor that could have driven a live mainnet defense
- × a Guard trusting arithmetic the LLM supplied
- × an RPC key leaking into a third-party prompt
- × a human veto that lasted exactly one tick

All fixed – each pinned by a regression test that fails against the pre-fix code. The full dated log is public: [FRICTION.md](#).

AGENTS DECIDE. RIPCORD IS HOW THE RESCUE LANDS.
